E155 Course Syllabus

Welcome to E155! We are excited about all the cool projects you will make, and we are glad to have you here. This course teaches students how to practically realize complicated digital electronic systems, including FPGAs, microcontrollers and some chips of your own choosing. It culminates with a project where you decide what you want to build.

At the end of the course you will be able to

- Read technical documentation for microcontrollers and other digital chips
- Write and interpret clean RTL
- Design combinational logic
- Design finite state machines
- Identify and derisk clock domain crossings and other sources of asynchrony
- Program a microcontroller to interact with real-world systems (motors, speakers, etc.) using C
- Program a microcontroller using modern techniques like HAL or RTOS
- Decide when to use peripherals in a microcontroller circuit
- Name and describe common communication protocols and their tradeoffs
- Select parts for a large digital system, and decide how to spread computation among those parts
- Work with Github and present your work on a portfolio website
- Scope, design and implement a digital electronics project of your choice!

Class Details

Item	Information
Instructors:	Prof. Josh Brake (Parsons 2364), Prof. Matt Spencer (Parsons 2358)
Lab Assistant(s):	Drake Gonzalez, Julia Gong, Quinn Miyamoto, Sadhvi Narayanan
Web page:	https://hmc-e155.github.io/
Lab Checkoff Sheet:	Sheet Link
Email list:	We don't use email, only Discord

Item	Information
Discord Server:	See intro email for invite.

Be sure to join the class Discord and check it regularly. It is be the only source of course-related communication for this semester.

Name	Info
Lecture	TR 1:15 - 2:30 pm
Lab Checkoff	TW afternoons by signup in the Digital Lab (PA B183)
Lab Hours	Friday – Quinn 7-8:30 PM Saturday – Julia 1-2:30 PM, Quinn 7-9 PM (4-6 PM on 9/5 only) Sunday – Sadhvi 2-4 PM, Drake 8-10 PM Monday – Drake 6-7:30 PM, Julia 7:30-9:30 PM Tuesday – Sadhvi 6-7:30 PM
Office Hours	Monday – Prof. Brake 1-3 PM, Prof. Spencer 3-5 PM

Schedule

Week #	Monday Date	Tuesday's Class	Thursday's Class	Due
1	8/31	Intro & Analog Behavior of Digital Systems	Combinational and Sequential Logic	Git & Quarto Portfolio Setup
2	9/7	Verilog Coding	Synchronous Design	Lab 1
3	9/14	Finite State Machines	Lab 3 Workshop	Lab 2
4	9/21	FPGA & MCU Documentation	GPIO Device Driver	Lab 3
5	9/28	Clock Configuration	Interrupts	Lab 4
6	10/5	Serial Interfaces Overview and SPI	UART and the IoT	Lab 5
7	10/12	Advanced Encryption Standard (AES)	Project Kickoff	Lab 6
8	10/19	**Happy Fall Break! No Class**	AES on FPGA Workshop	Project Proposal Reviews

Week #	Monday Date	Tuesday's Class	Thursday's Class	Due
9	10/26	Advanced Topics	Advanced Topics	Lab 7
10	11/2	Advanced Topics	Advanced Topics	Lab redo week / proposal redos
11	11/9	Design Review Presentations	Design Review Presentations	
12	11/16	Design Review Presentations	Advanced Topics	Status Demo
13	11/23	Project Status Report and Demo	**Happy Thanksgiving! No class**	
14	11/30	Advanced Topics	Advanced Topics	Project help / office hours
15	12/7	Advanced Topics	Special Topics / Guest Lecture	Final Demo (Tue) and Demo Day (Fri 12/11, last day of classes)

You will be working on labs on your own time and it is not required that you attend the entire scheduled lab period. Instead, sign up for a time to get your lab checked off. Please sign up for a time during your lab section. If you are unable to find a spot that works for you, see if you can swap with one of your classmates. If you are still having trouble finding a time that works for you, reach out and let us know.

Recommended Texts

We assume you have a solid grasp of digital design at the level of E85; review Digital Design and Computer Architecture, ARM Edition (link) if you feel rusty on a topic. We will not be closely following a textbook, but you may find The Definitive Guide to ARM® Cortex®-M3 and Cortex®-M4 Processors by Joseph Yiu to be a helpful, comprehensive reference for the microcontroller. An electronic version of the book is available through the library (link).

Lab Kit

While there is not a textbook to purchase, you will need to buy a lab kit. The fee is $75 in Claremont Cash, and should be paid by filling out the Google Form (link) which authorizes Sydney Torrey in the Engineering office to charge your Claremont Cash account. Once you have paid for your kit via the form, see Jacob Staimpel in the stockroom to pick up your kit. If you cook your board this semester, you can buy and rebuild a replacement, but ask an

instructor for help troubleshooting first. You'll also check out a large breadboard from the stockroom, and will need to return it at the end of the semester.

The kit fee can be waived in cases of financial hardship. To request a waiver fill out the form here (link). Course instructors will not know about waiver requests.

You will also need to check out a breadboard for the semester. You can do so by talking to Jacob Staimpel in the stockroom.

Lab Access

The Digital Lab (Parson B183) is available for you to use when working on your labs. The current door code will be shared privately. There are Windows PCs available with SEGGER Embedded Studio and Lattice Radiant installed along with the drivers required to program your board. The lab also has the electronics assembly equipment needed to solder, oscilloscopes and power supplies at the lab stations, and a lab cabinet with various resistors and some of the parts like wires, seven-segment LEDs, and transistors you will need for some of your labs. You are welcome to use these while working on your lab, but please make sure to return the components to the lab cabinet when you are done.

In addition, the software we will be using for programming the MCU (SEGGER Embedded Studio for ARM) and FPGA (Lattice Radiant) are free and supported on a variety of platforms if you wish to download them on your personal computer. SEGGER Embedded Studio is supported on Windows, MacOS, and Linux and Lattice Radiant is supported on Windows and Linux. If you are running MacOS, you can download and virtualize Windows using VMWare Fusion Pro under a Personal Use License for free. More details and download links can be found here (link).

Grading

There are three categories of assignments that you will be graded on in this class:

1. Labs (including AI reflections)
2. Project
3. Completion-graded assignments: the pre-assessment, the post-assessment, setting up your portfolio, etc.

Labs in this class are graded using specifications-grading, which may be a bit different than what you have seen in other classes. Under specifications grading, the grade you earn in the class will be determined based the number of deliverables you successfully complete and the level of polish to which you complete them. Each assignment will contain a list of specifications (or specs) for two levels of completeness: proficiency and excellence. The list of specifications are designed to be aligned with the learning goals for the assignment. The proficiency specifications will

indicate the level of completeness that demonstrates that you have achieved a level of comfort with the material in the assignment such that you would be able to implement the learning outcomes in a different setting. Meeting the excellence specs for an assignment indicates that you have not only achieved the basic level of expected knowledge of the material, but have truly understood and are able to apply the techniques with deftness.

You need to earn the following number of proficiency and excellence specifications to earn a given grade in the class. The weight each grade will contribute to your final grade (see below) is also shown.

Grade	Proficiency	Excellence	Weight in Final Grade
A	7	6	100
A-	7	5	97
B+	6	4	93
B	6	3	90
B-	6	2	85
C+	5	2	80
C	5	1	75
C-	5	0	70
D	4	0	65
F	less	0	0

Retrying labs to improve learning is an essential part of specifications grading pedagogy, and allowing flexibility is an important part of helping classes to effectively serve students. To that end, each student has two redo tokens that allow them to turn in a lab up to a week late or redo a lab. A "redo week" is included in the course schedule to allow students to use their redo tokens, though note that the redo week will be busy and taking advantage of office hours to redo labs earlier will give you more attempts.

These redo tokens are intended for major reworking of labs. It is common for students to make small mistakes that put them out of specification, and instructors may respond by granting a "minor redo", which allows students to work for a few more minutes (maybe 30, generally bounded by the end of the lab section) to correct an error. These minor redos do not count against your two redo tokens.

The project will be graded using traditional grading. Rubrics for each project component will be provided on appropriate project pages. Components of the project will be weighted as follows:

- Proposal: 10% (note that you have two attempts at submitting a proposal, almost everyone needs both attempts!)
- Design Review Presentation: 20%
- Midpoint Status Report + Checkoff: 20%

- Final Checkoff: 30%
- Final Report: 20%

Your final grade will be determined by the following weights:

- Labs: 45% (weighted by grade as shows above)
- Project: 45% (each component may be weighted by rubric)
- Completion-Graded Assignments: 5%
- Instructor Participation Score: 5%

Collaboration Policy

Your peers are an excellent source of support and can be a great help as you complete MicroPs. With that said, it is important that each student in the class do the work for themselves to develop their own expertise. The collaboration policy for MicroPs is as follows:

Collaboration Policy

You **should**:

- Discuss high level questions about the approach to the lab **after** you have spent time developing your own initial approach.
- Ask for feedback on your Verilog code **after** both you and the person you are asking to review your code have made a significant attempt on your own.
- List on your lab writeup any people that have reviewed your work or for whom you have reviewed work.
- Ask an instructor any question you think might be inappropriate to discuss with a peer.

You may **not**:

- Pair program.
- Use code that you have not personally typed (e.g., do not copy-paste code from any source). Note that this policy does not apply to the portions of your lab where you are encouraged to use AI.
- Directly copy code from any other person.
- Use any source code in your project without citation (e.g., if you use a module from a textbook or another online source, be sure to cite it in the comments of your code.).

AI Policy

Harvey Mudd is piloting AI/LLM use language that instructors can adopt in their syllabi. During the labs in this course, we are closest to level 0 - no AI use allowed. During the project we are closest to level 3 - full AI use allowed.

Academic work on the effects of AI on learning are still nascent, but a case study in a course similar to ours suggested that students who rely on AI early in the course often struggle with concepts later in the course. However, LLMs are rapidly transforming industrial practice in software development and digital engineering, and other academic work suggests that an AI with expert prompting can succeed in programming a microcontroller to the level required by a class. Absolutely terrifying quantitative work suggests that LLMs displace learning even in populations highly motivated to use them to learn.

Therefore, this course is taking a cautious stance about engagement with AI. Many of the learning goals (especially learning to interpret documentation and RTL) are undermined by the use of AI. Therefore, in the policy outlined below, AI will be allowed only on "AI prototype" questions in the labs. During the project, we are amenable to more liberal AI use because you will have demonstrated many fundamental skills from the class. We can discuss more at the project launch.

> **i** Using AI in MicroPs
>
> In MicroPs this fall we will adopt the following policies for generative AI use during labs 1-7:
> You **should**:
>
> - **Use AI on the AI prototypes throughout the course.** Each lab this fall will include a section describing a generative AI experiment. For the tasks in these sections you are required to leverage generative AI. As you embrace AI, we would encourage you to reflect on your experience using it and on its impact on your skill development. Your reflections on these AI experiments each week are a great topic to discuss in your weekly reflections.
>
> You should **not**:
>
> - **Use generative AI to directly generate any code on the main lab design challenges.** Learning how to write Verilog and C code is a core learning objective in this class. The best way to learn how to evaluate the quality of LLM-generated code is by first writing a large quantity of it for yourself.
> - **Use generative AI to generate any of your technical documentation.** Thinking is writing, and learning how to articulate what you've done and what it means matters. Outsourcing this task to an LLM will not help you to better understand the work you are doing. As noted above, you may use spellcheckers, but

you must not use tools which will rewrite sentences for you or generate text (e.g., Google's "Help Me Write" feature)
- **Use generative AI to summarize or search datasheets** Learning to read datasheets is a foundational and essential skill in this discipline, and verifying AI's work is much harder if you haven't read datasheets on your own at first.

Honor Code Policy

Students in this class are expected to follow the HMC honor code. An honor code policy appears below and prescribes behavior that is considered honorable, so read those maxims and follow them closely. Any honor code violations will be handled through JB.

If you believe you have violated the honor code in any way, please take the initiative to self report so that we can come up with a fair and just path forward together.

1. All students enrolled in this course are bound by the HMC Honor Code. More information on the HMC Honor Code can be found in the HMC Student Handbook.
2. It is your responsibility to determine whether your actions adhere to the HMC Honor Code. If this document does not clarify the legitimacy of a particular action, you should contact a course instructor and request clarification.
3. Work you submit for individual assignments should be your own, and you should complete all assignments based on your own understanding of the underlying material. If you work with, or receive help from, another individual on an assignment, provide a written acknowledgement in complete sentences that includes the person's name and the nature of the help.
4. This document is not meant to be an exhaustive list of every possible Honor Code violation. Infractions not explicitly mentioned here may still violate the Honor Code.
5. **Boundaries of Collaboration.** Verbal collaboration with other students on individual assignments is encouraged **after** you have given serious thought to each component yourself. However, all submitted written work should be written by yourself individually, and not a collaborative effort or copied from a common source (e.g., a chalkboard). It is **not** acceptable to work on labs in lockstep with another classmate.
6. **Use of Computer Software.** The use of graphing calculators and computer software to aid in course work is acceptable, as long as it does not substitute for an understanding of the course material.
7. **Use of Web Resources.** The use of Internet resources to aid in course work is acceptable, as long it does not substitute for an understanding of the course material. Plagiarism and direct copying from online (or any other) sources is strictly prohibited.
8. **Use of Your Own Work from Previous Semesters.** If you have previously attempted this course, you may resubmit your work from previous semesters as this semester's coursework, as long as you understand the underlying material.

9. **Use of Other Course Resources from Previous Semesters.** You may not reference assignments (labs, problem sets, activities) of this course from previous semesters.
10. **Retention of Course Resources.** Assignments and exams from this course may not be committed to dorm repositories or otherwise used to help future students.

Inclusiveness and Harassment

We do difficult work in this class and everyone should feel comfortable engaging with the material. We explicitly want you to feel safe doing this work, so it is worth stating that the instructors are committed to making the class a safe space for everyone regardless of race, gender, ethnicity, sexual orientation, religion, and academic history. If you feel that you are experiencing a hostile environment, speak to an instructor immediately.

Educational Accessibility

HMC is committed to providing an inclusive learning environment and support for all students. Students with a disability (including mental health, chronic or temporary medical conditions) who may need some accommodation in order to fully participate in this class are encouraged to contact Educational Accessibility Services at ability@g.hmc.edu to request accommodations. Students from the other Claremont Colleges should contact their home college's disability resources officer.
